Perioperative treatment options in resectable pancreatic cancer: How to improve long-term survival

Marianne Sinn, Marcus Bahra, Timm Denecke, Uwe Pelzer, Hanno Riess

Abstract

12

Surgery remains the only chance of cure for pancreatic cancer, but only 15-25 % of patients present with resectable disease at the time of primary diagnosis. Important goals in clinical research must therefore be to allow early detection with convenient diagnostic procedures, to further broaden operation techniques and to define the most effective perioperative treatment of either chemotherapy or radiation therapy.

More extended operations in specialised centers in which extended pancreatectomy
