Understanding the cellular and molecular mechanisms in the pathogenesis of diabetic tendinopathy

Pan-Pan Lu, Min-Hao Chen, Guang-Chun Dai, Ying-Juan Li, Liu Shi, Yun-Feng Rui

Abstract

There is accumulating evidence of an increased incidence of tendon disorders in people with diabetes mellitus. Diabetic tendinopathy is an important cause of chronic pain, restricted activity and even tendon rupture in individuals. Tenocytes and tendon stem/progenitor cells (TSPCs) are the dominant cellular components associated with

May 14, 2008 · One of the reasons there are very few, if any, good treatments for **tendinopathy** is lack of knowledge regarding its **pathogenesis**. We summarize recent **cellular and molecular** findings in **tendinopathy** to identify potential preventative and treatment strategies and specific areas needing further investigation.
