We examined the diagnostic accuracy of **molecular analysis of pancreatic cyst fluid** (i.e., the presence of a K- ras mutation and LOH at **tumor-suppressor** loci) as compared with surgical pathology in 40 **cystic neoplasms**; this population tended to be low- or intermediate-risk according to standard criteria for **surgical resection** [1-3]. We found that individual **molecular alterations** were less accurate than **cyst fluid** ...

Currently, molecular analysis is a commercially available test that promises an accurate diagnosis. The objective of the **current study** was to correlate a commercially provided **molecular diagnosis** (MDx) with a **clinical consensus diagnosis** (CCD) in the general categories of malignant, **benign mucinous**, and benign **nonmucinous pancreatic cysts**.
