**Update on novel endoscopic therapies to treat gastroesophageal reflux disease:  
A review**

### Abstract.

Endoscopic treatments for GERD have become increasingly popular in recent years. While **1** surgical intervention with the Laparoscopic Nissen Fundoplication remains **2** the gold standard, two endoscopic interventions, specifically, are gaining traction in clinical use (EsophyX and Stretta). **9** The EsophyX (EndoGastric Solutions, Inc., Redmond, WA, USA) was developed as a method of restoring the valve at the GE junction through an endoluminal fundoplication (ELF) **7** technique. Long-term data suggests that TIF with EsophyX may be effective for symptom control and PPI reduction or cessation for up to 2-6 years. There is no evidence that EsophyX is more effective than surgical intervention. TIF may be most effective for patients with HH < 2 cm and Hill Grade I/II valves. **4** Stretta (Mederi Therapeutics, Greenwich, CT, USA) was approved by the FDA in 2000. It delivers **11** radiofrequency energy to the LES and gastric cardia. Published **41**
