Hepatogastric fistula: A rare complication of amebic liver abscess

Sunil V Pawar, Vinay G Zanwar, Pravir A Gambhire, Ashok R Mohite, Ajay S choksey, Pravin M Rath, Dileep S Asgaonkar

Abstract

Amebic liver abscess is a parasitic disease which is often encountered in tropical countries. A hepatogastric fistula secondary to an amebic liver abscess is a rare complication of this disease and there are only a handful of reported cases in literature. Here we present a case of an amebic liver abscess which was complicated with the development of a hepatogastric fistula. The patient presented with the pain and distension of abdomen, jaundice which improved partially after he had an episode of brownish black color increase frequency of stools for 5 to 6 days. Patient also had ascites and anemia. He was a chronic alcohol drinker. Esophagogastroduodenoscopy performed in view of the above findings. It showed a fistulous opening with bilious secretions along the lesser curvature of the stomach. On imaging multiple liver abscesses including one in sub capsular location. The patient was managed conservatively with antiamebic medications along with proton pump inhibitors. The pigtail drainage of the sub capsular abscess was done. The patient improved significantly. The repeat endoscopy performed after about two months showed
