Retrospective Study

Bleeding risk with clopidogrel and percutaneous endoscopic gastrostomy

 Umair Sohail, Chela Harleen, Amin O Mahdi, Murtaza Arif, Douglas L Nguyen,
 Matthew L Bechtold

Abstract

 AIM: To compare bleeding within 48 hours in patients undergoing PEG with or without
 clopidogrel.

 METHODS: After IRB approval, a retrospective study involving a single center was
 conducted on adult patients having PEG (1/08-1/14). Patients were divided into two
 groups: Clopidogrel group consisting of those patients taking clopidogrel within 5 days
 of PEG and the non-clopidogrel group including those patients not taking clopidogrel
 within 5 days of the PEG.

 RESULTS: 319 PEG patients were found. 168 males and 151 females with mean BMI
 $28.47 \pm 9.75 \text{ kg/m}^2$ and mean age 65.03 ± 16.11 years were identified. 33 patients were
