Abstract

Russell body gastritis (RBG) is an unusual type of chronic gastritis characterized by marked infiltration of Mott cells, which are plasma cells filled with spherical eosinophilic bodies referred to as Russell bodies. It was initially thought that *Helicobacter pylori* (*H. pylori*) infection was a major cause of RBG and that the infiltrating Mott cells were polyphenotypic; however, a number of cases of RBG without *H. pylori* infection or with monoclonal Mott cells have been reported. Thus, diagnostic difficulty
