## Non-Alcoholic fatty liver disease

Medical Condition

A condition in which fat accumulates in the liver in people who drink little or no alcohol.

-  Very common (More than 3 million cases per year in US)
-  Diagnosis requires lab test or imaging
-  Treatments can help manage condition, no known cure
-  Can last several years or be lifelong

The cause of non-alcoholic fatty liver disease is not clearly understood. It is associated with obesity, insulin resistance, hyperglycemia, and high levels of fat in blood. The condition does not usually cause symptoms. In some cases, fatigue, enlarged liver, and pain in the upper right abdomen is seen. Non-alcoholic fatty liver disease has no specific treatment. It involves treating underlying conditions such as obesity.
