Abstract

BACKGROUND

Herbal supplements (HS) for weight loss are perceived to be “safe” and “natural”, as advertised in ads, however, hepatotoxicity can be associated with consumption of some HS. Use of HS may be missed, as the patient may not report these unless specifically asked about these products, since they are often not thought of as medications with potential side effects or interaction potential.

CASE SUMMARY

We reported a case of a 21-year-old female with morbid obesity who presented with abdominal pain for 1 wk associated with nausea, vomiting, anorexia and myalgias. She denied tobacco smoking, drinking alcohol, usage of illicit drugs, hormonal contraceptives, or energy drinks. There was no significant past medical or family illness. Her laboratory workup revealed acute liver failure. The workup for possible etiologies of acute liver failure was unremarkable. She was using a weight loss herbal supplement “*Garcinia cambogia*” for 4 wk. This case demonstrates the association of acute liver failure

Dara et al[1] report on a case series of two patients with hepatotoxicity associated with the **weight-loss supplement Hydroxycut**, so named because it contains potentially hepatotoxic hydroxycitric acid derived from the tropical fruit *Garcinia cambogia* [1]. Two earlier case reports in 2005 were also referenced[2].
