COVID-19 and the liver

https://pubmed.ncbi.nlm.nih.gov/32553666

During the previous SARS epidemic, around 60% of patients were reported to develop various degrees of liver damage. In the current pandemic, hepatic dysfunction has been seen in 14-53% of patients with COVID-19, particularly in those with severe disease. Cases of acute liver injury have been reported and are associated with higher mortality.

What to Know About Liver Disease and COVID-19 | CDC

https://www.cdc.gov/.../liver-disease.html •

Feb 08, 2021 · Some patients hospitalized for COVID-19 have had increased levels of liver enzymes — such as alanine aminotransferase (ALT) and aspartate aminotransferase (AST). Increased levels of liver enzymes can mean that a person's liver is at least temporarily damaged. People with cirrhosis [liver scarring] may be at increased risk of COVID-19.
