Abstract

AIM: To compare the surgical outcomes between laparoscopic liver resection (LLR) and open liver resection (OLR) as a curative treatment in patients with hepatocellular carcinoma (HCC).

METHODS: A PubMed database search was performed systematically to identify comparative studies of LLR versus OLR for HCC from 2000 to 2014. An extensive text word search was conducted, using combinations of search headings such as 'laparoscopy', 'hepatectomy', and 'hepatocellular carcinoma'. A comparative study was also performed in our institution where we analysed surgical outcomes of 152 patients who underwent liver resection between January 2005
