**Antiviral therapies for chronic HCV infection with cirrhosis**

Shingo Nakamoto, Tatsuo Kanda, Hiroshi Shirasawa, Osamu Yokosuka

**Abstract**

Patients who are infected <sup>33</sup>with hepatitis C virus (HCV) and also have advanced fibrosis or <sup>80</sup>cirrhosis have been recognized as 'difficult-to-treat' patients during an era when peginterferon and ribavirin combination therapy is the standard of care. Recent guidelines have clearly stated that treatment should be prioritized in this population to prevent <sup>41</sup>complications such as decompensation and hepatocellular carcinoma (HCC). <sup>68</sup>
