New prognostic markers in liver cirrhosis

Vincent Di Martino, Delphine Weil, Jean-Paul Cervoni, Thierry Thevenot

Abstract

Determining the prognosis of cirrhotic patients is not an easy task. Prognostic scores, like Child-Pugh and MELD scores, are commonly used by hepatologists, but do not always reflect superimposed events that may strongly influence the prognosis. Among them, bacterial intestinal translocation is a key phenomenon for the development of cirrhosis-related complications. Several biological variables (CRP, serum free cortisol, coceptin, von Willebrand factor antigen) are surrogates of 'inflammatory stress' and have recently been identified as potential prognostic
