Outcomes of liver transplantation in patients with hepatorenal syndrome

Rohan M Modi, Nishi Patel, Sherif N Metwally, Khalid Mumtaz

Abstract

Purpose of review: Hepatorenal syndrome (HRS) plays an important role in patients with liver cirrhosis on wait list for liver transplant. The 1 and 5-year probability of developing HRS in cirrhotic with ascites is 20% and 40%, respectively. 2 In this article, we reviewed current concepts in HRS pathophysiology, guidelines for HRS diagnosis, effective treatment options presently available, and controversies surrounding liver alone versus simultaneous liver kidney transplant (SLKT) in transplant candidates.

Main Findings: Many treatment options including albumin, vasoconstrictors, RRT, and eventual liver transplantation have remained a mainstay in the treatment of HRS. Unfortunately, even after aggressive measures such as terlipressin use, the rate of recovery is less than 50% of patients. Moreover, current SLKT guidelines include 1) eGFR of 30 ml/min or less for 4-8 weeks 2)
