Prospective Study

Early mortality and rebleeding rate following acute variceal haemorrhage in patients with liver cirrhosis and Schistosomal periportal fibrosis: A clinical prospective comparison

Sara Elfadil Abbas Mohammed, Abdelmunem Eeltayeb Abdo, Hatim Mohamed Yousif Mudawi

Abstract

AIM: To investigate mortality and rebleeding rate and identify associated risk factors at 6 weeks and 5 days following acute variceal haemorrhage in patients with liver cirrhosis and Schistosomal periportal fibrosis.

METHODS: This is a prospective study conducted during the period from March to December 2014. Patients with portal hypertension presenting with acute variceal haemorrhage secondary to either liver cirrhosis(Group A) or Schistosomal periportal fibroses (Group B) presenting within 24 hours of the onset of the bleeding were enrolled in the study and followed for a period of 6 weeks. Analysis of data was done by Microsoft Excel and comparison between groups was done by Statistical Package of Social Sciences (SPSS) version 20 to calculate means and find the levels of statistical differences and define the mortality rates, the P value of
