Hepatitis C eradication with sofosbuvir leads to significant metabolic changes

Amilcar L Morales, Zachary Junga, Manish B Singla, Maria Sjogren, Dawn Torres

Abstract

5

**AIM:** To assess the effect of sofosbuvir (SOF) based regimens on glycemic and lipid control.

**METHODS:** This is a retrospective analysis of HCV-infected patients treated and cured with a sofosbuvir regimen (sofosbuvir/ribavirin/interferon, sofosbuvir/simeprevir, or sofosbuvir/ledipasvir ± ribavirin) from January 2014 to March 2015. Patients with hemoglobin A1C (HbA1C) and lipid panels within six months before and six months after therapy were identified and included in our study. Due to the known hemolytic effect of ribavirin, HbA1C was obtained a minimum of three months post-treatment for the patients treated with a ribavirin regimen. Medical history, demographics, HCV genotype, pre-therapy
