Focal liver lesions found incidentally

Abdullah A Algarni, Abdullah H Alshuhri, Majed M Alonazi, Moustafa Mabrouk Mourad, Simon R Bramhall

Abstract

Incidentally found focal liver lesions (FLLs) are a common finding and a reason for referral to hepatobiliary service. They are often discovered in patients with history of liver cirrhosis, colorectal cancer, incidentally during work up for abdominal pain or in a trauma setting. Specific points should be considered during history taking such as risk factors of liver cirrhosis; hepatitis, alcohol consumption, substance exposure or use of oral contraceptive pills and metabolic syndromes. Full blood count, liver function test and tumor markers can act as a guide to minimize the differential diagnosis and to categorize the degree of liver disease. Imaging should start with B-mode ultrasound (B-US). If available, contrast enhanced ultrasound (C-US) is a feasible, safe, cost-effective option and increases the ability to reach a diagnosis.

Match Overview

1	Internet 118 words crawled on 01-Dec-2014 www.plosone.org	5%
2	CrossCheck 68 words M. S. Campbell. "The evolving role of liver biopsy", <i>Alimentary Pharmacology and Therapeutics</i> , 8/2004	3%
3	Internet 14 words crawled on 15-Nov-2015 www.science.gov	1%
4	CrossCheck 13 words Chung, Yong Eun, Myeong-Jin Kim, Yeo-Eun Kim, Mi-Suk Park, Jin Young Choi, and Ki Whang Kim. "Characterization of focal liver lesions found incidentally during work up for abdominal pain or in a trauma setting"	1%
5	CrossCheck 11 words Chet HAMMILL. "Cholangiocarcinoma in USA- versus Asian-born Asians: Is viral hepatitis a factor?", <i>Asia-Pacific Journal of Surgery</i>	<1%
6	CrossCheck 10 words Barreiros, Ana Paula, Fabio Piscaglia, and Christoph F. Dietrich. "Contrast enhanced ultrasound for the diagnosis of focal liver lesions"	<1%
