Hepatic Kaposi sarcoma: **A case report and review of the literature**

Brett Daniel Van-Leer Greenberg, Abhisake Kole, Saurabh Chawla

**Abstract**

Kaposi sarcoma (KS) is an aggressive cancer caused by human herpesvirus-8 (HHV-8), primarily seen in immunocompromised patients. As opposed to the well-described cutaneous manifestations and pulmonary complications of KS, hepatic KS is rarely reported before death as most patients with hepatic KS do not manifest symptoms or evidence of liver injury. In patients with AIDS, hepatic involvement of KS is present in 12-24% of the population on incidental imaging and in approximately 35% of patients with cutaneous KS if an autopsy was completed after their death. Patients with clinically significant hepatic injury due to hepatic Kaposi sarcoma usually have an aggressive course of disease with hepatic failure often progressing to multi-organ failure and death. Here we report an unusual presentation of acute liver injury (ALI) due to hepatic Kaposi sarcoma and briefly review the published literature on Hepatic Kaposi sarcoma.

**Match Overview**

- | Rank | Crossref  | Words    | Match |
|------|---|----------|-------|
| 1    | Gbabe, Oluwatoyin F, Charles I Okwundu, Martin Dedicoat, Esther E Freeman, and Oluwatoyin F Gbabe. "Treatment of Hepatic Kaposi Sarcoma in HIV/AIDS Patients: A Case Report and Review of the Literature" | 66 words | 2%    |
