An overview on drug-induced liver injury in Brazil

Drug-induced liver injury in Brazil

Abstract

Drug-induced liver injury (DILI) is an uncommon event in clinical practice, which makes knowing its true incidence difficult. Prospective, retrospective and registry-based studies are the most important methods to obtain epidemiological data on DILI. Latin America (LA) has a historical lack of prospective studies on this topic. New definitions and the creation of hepatotoxicity registries have significantly improved the epidemiological understanding of hepatic drug reactions in several regions of the world. The Latin American DILI network, referred to as LATINDILI, has been created

Overview of drug induced liver injury in Brazil: What is ...

<https://pubmed.ncbi.nlm.nih.gov/34046243>

Hepatotoxicity can be **induced** both by non-prescription **drugs** and by those used for chronic diseases. It is the main cause of safety-related **drug** marketing withdrawals and could be responsible for irreversible and fatal **injuries**. Aim: To identify and to summarize **Brazilian** studies reporting the **drug-induced liver injury**.

Drug-induced liver injury, also known as **drug-induced liver injury (DILI)**, is the main cause of discontinuation of new **drug** research and for their withdrawal from the market during the marketing period. Some mechanisms have been described according to the drug, but these are not fully known yet.
