<sup>5</sup>Role of peroxisome proliferator-activated receptors alpha and gamma in gastric ulcer:  
An overview of experimental evidences

Lekha Saha

**Abstract**

Peroxisome proliferator-activated receptors (PPARs) are ligand-activated transcription factors belonging to the nuclear hormone receptor superfamily. Three subtypes, PPAR $\alpha$ , PPAR $\beta/\delta$ , and PPAR $\gamma$ , have been identified so far. PPAR $\alpha$  is expressed in the liver, kidney, small intestine, heart, and muscle, where it activates the fatty acid catabolism and control lipoprotein assembly in response to long-chain unsaturated fatty acids, eicosanoids, and hypolipidemic drugs (e.g., fenofibrate). PPAR $\beta/\delta$  is more broadly expressed and is implicated in fatty acid oxidation, keratinocyte differentiation,
