**Massive duodenal variceal bleed; complication of extra hepatic portal hypertension -
Endoscopic management and literature review**

Christopher Steevens, Maisa Abdalla, Truptesh H Kothari, Vivek Kaul, Shivangi Kothari

Abstract

Bleeding from duodenal varices is reported to be a catastrophic and often fatal event. Most of the cases in the literature involve patients with underlying cirrhosis. However, approximately one quarter of duodenal variceal bleeds are caused by extrahepatic portal hypertension and they represent a unique population given their lack of liver dysfunction. The authors present a case where a 61-year-old male with history of remote crush injury presented with bright red blood per rectum and was found to have bleeding from massive duodenal varices. Injection sclerotherapy with ethanolamine was performed and the patient experienced a favorable outcome with near resolution of
