Disaccharidase activity in children undergoing esophagogastroduodenoscopy:  
A systematic review

Taylor Daileida, Peter Baek, Morgan E Sutter, Kalpesh Thakkar

**Abstract**

**Objectives:** Intestinal disaccharide analysis of duodenal biopsy specimens are often obtained during esophagogastroduodenoscopy (EGD) in children. We performed a systematic review of studies examining disaccharide activity from biopsy specimens in children undergoing EGD.

**Methods:** All full-length articles published in English during 1966-2014 were included if: (i) participants had small intestinal biopsy evaluation of disaccharide activity, (ii) levels of lactase, sucrase, maltase or palatinase were reported, (iii) age of participants was under 18 years.

**Results:** Thirty articles examining 34,753 disaccharide assays fulfilled the specific search, inclusion, and exclusion criteria. All of the studies were observational in design and 57% (17) were prospective. Sixteen studies were conducted in the USA and 9 European studies were identified. The highest
