Selecting the best strategy of treatment in newly diagnosed advanced-stage ovarian cancer patients

Lucas Minig, Cristina Zorrero, Pablo Padilla Iserte, Andres Poveda

#### Abstract

Although it is assumed that the combination of chemotherapy and radical surgery should be indicated in all newly diagnosed advanced-stage ovarian cancer patients, one of the main raised questions is how to select the best strategy of initial treatment in this group of patients, neoadjuvant chemotherapy followed by interval debulking surgery or primary debulking surgery followed by adjuvant chemotherapy. The selection criteria to offer one strategy over the other as well as a stepwise patient selection for initial treatment are described. Selecting the best strategy of treatment in newly diagnosed advanced stage ovarian cancer patients is a multifactorial and multidisciplinary decision. Several factors should be taken into consideration: 1) the disease factor, related to the extension and localization of the disease as well as tumor biology; 2) the patient factor, associated with patient age, poor performance status, and co-morbidities; 3) and institutional infrastructure
