Blunt diaphragmatic lesions: Imaging findings and pitfalls

Matteo Bonatti, Fabio Lombardo, Norberto Vezzali, Giulia A Zamboni, Giampietro Bonatti

Abstract

Blunt diaphragmatic lesions (BDL) are uncommon in trauma patients, but they should be promptly recognized as a delayed diagnosis increases morbidity and mortality. It is well known that BDL are often overlooked at initial imaging, mainly because of distracting injuries to other organs. Sonography may directly depict BDL only in a minor number of cases. Chest x-ray has low sensitivity in detecting BDL and lesions can be reliably suspected only in case of intra-thoracic herniation of abdominal viscera. Thanks to its wide
