Prospective Study

15 Follow-up of endovascular aortic aneurysm repair: Preliminary validation of digital tomosynthesis and contrast enhanced ultrasound in detection of medium- to long-term complications

Abstract

12 **31** AIM: to validate, the feasibility of digital tomosynthesis of the abdomen (DTA) combined with contrast enhanced ultrasound (CEUS) in assessing complications after endovascular aortic aneurysm repair (EVAR), assuming computed Tomography Angiography (CTA) as gold standard.

METHODS: for this prospective study we enrolled 163 patients (123 men, mean age, 65.7 years) referred for CTA for EVAR follow-up. CTA, DTA and CEUS were performed at 1 and 12 months in all patients, with a time interval at maximum of 2 days.
