Basic Study

Evaluating the quality of evidence for diagnosing ischemic heart disease from verbal autopsy in Indonesia

Zhang W *et al.* Diagnosis of IHD from VA

Wenrong Zhang, Yuslely Usman, Retno Widyastuti Iriawan, Merry Lusiana, Sha Sha, Matthew Kelly, Chalapati Rao

Abstract

BACKGROUND

Mortality and cause of death data, are fundamental to health policy development. Civil Registration and Vital Statistics (CRVS) systems are the ideal data source, but CRVS is still under development in Indonesia. A national Sample Registration System (SRS) has provided nationally representative mortality data from 128 sub-districts since 2014. Verbal autopsy (VA) is used in the SRS to obtain cause of death. The quality of VA data must be evaluated as part of SRS data quality assessment.

AIM

To assess strength of evidence used in assignment of Ischaemic Heart Disease (IHD) as cause of death from VA.

METHODS

The sample frame for this study is the 4070 deaths which had IHD assigned as underlying cause in the SRS 2016 database. From these, 400 cases were randomly selected. A data extraction form and data entry template were designed to collect relevant data about IHD from the VA questionnaires. A standardised categorisation

May 18, 2018 · Verbal autopsy (VA) is a method of ascertaining cause of death (COD) from information on signs/symptoms and circumstances preceding death through interviewing the deceased's caretakers . VA is used as a research tool for longitudinal population studies, intervention research and epidemiological studies.
