The case highlights challenges in the diagnosis of cardiac **amyloidosis** and the enormous impact of multimodality **imaging** in contemporary cardiology. We diagnosed familial, mutant **amyloid transthyretin** (ATTR) **amyloid cardiomyopathy** in a septuagenarian with marked LV wall thickness and refractory diastolic heart failure.

Abstract

Transthyretin amyloid (TTR) cardiomyopathy is a disease of insidious onset, which is often accompanied by debilitating neurological and/or cardiac complications. The true prevalence is not fully known due to its elusive presentation, being often under-recognized and usually diagnosed only late in its natural history and in older patients. Because of this, effective treatment

Dec 18, 2017 · We diagnosed familial, mutant amyloid transthyretin (ATTR) amyloid cardiomyopathy in a septuagenarian with marked LV wall thickness and refractory diastolic heart failure. A constellation of cardiac imaging modalities guided our approach in this case, which had important implications for family members who were recommended genetic screening.

Targeted radionuclide imaging of amyloidosis is a robust method to image cardiac amyloid deposition. Radionuclide imaging is typically considered for the diagnosis of amyloidosis in individuals with a high clinical suspicion for ATTR cardiac amyloidosis.

Three main imaging techniques are commonly used to identify cardiac transthyretin (ATTR) amyloidosis: echocardiography, MRI and DPD scintigraphy. Each one provides specific diagnostic and prognostic informations but also has its specific limitations. We sought to evaluate a multimodality imaging strategy to diagnose cardiac amyloidosis in ATTR.
