Personalized chemotherapy in clear cell adenocarcinoma of the urethra: A case report

Lisa B E Shields, Arash Rezazadeh Kalebasty

Abstract

BACKGROUND

Clear cell adenocarcinoma of the urethra is a rare type of aggressive cancer with a poor prognosis. Clear cell carcinoma of the urethra represents less than 0.02% of all malignancies in women. Adenocarcinomas account for 10% of female urethral carcinomas, of which 40% are the clear cell variant. Determining the presence or absence of certain mutations through genetic testing may predict whether a patient with cancer may benefit from a particular chemotherapy regimen.
