Peripheral reflex feedbacks in chronic heart failure: Is it time for a direct treatment?

Alberto Giannoni, Gianluca Mirizzi, Alberto Aimò, Michele Emdin, Claudio Passino

Abstract

1
 Despite repeated attempts to develop a unifying hypothesis that explains the clinical syndrome of heart failure (HF), no single conceptual paradigm for HF has withstood the test of time. The last model that have been developed, the neurohormonal model, had the great virtue of highlighting the role of the heart as an endocrine organ, as well as to shed some light on the key role on HF progression of neurohormones and peripheral organs and tissues beyond the heart itself. However, while survival in clinical trials based on neurohormonal antagonist drugs has improved, HF currently remains a lethal condition
