Thrombus aspiration during primary percutaneous coronary intervention for acute myocardial infarction; A review of clinical evidence and guidelines

Muhammad Muzaffar Mahmood, Jonathan Watt, Javed M Ahmed

Abstract

Acute ST segment elevation myocardial infarction (STEMI) is characterized by complete thrombotic occlusion of a major coronary artery. Early recanalization of the infarct-related artery is most efficiently delivered by primary percutaneous coronary intervention (PPCI), however this does not always restore normal myocardial perfusion, mainly due to distal embolization of the thrombus and microvascular obstruction. Early evidence for manual thrombus aspiration during PPCI was promising and this was
