Salmonella Berta myocarditis: Case report and systematic review of non-typhoid salmonella myocarditis

Pedro Villablanca, Divyanshu Mohananey, Garnet Meier, John E Yap, Sonam Chouksey, Ayokunle T Abegunde

Abstract

AIM: To study trends in the epidemiology, clinical presentation, microbiology and prognosis of non-typhoid *Salmonella* (NTS) myocarditis.

METHODS: We performed a systematic literature search for all reported NTS cases. The search yielded 838 publications. A total of 21 papers were deemed eligible. No language restrictions were enforced. Articles that were not written in English were translated. Pre-specified data such as clinical presentation, ECG changes, transthoracic echocardiographic (TTE) findings, cardiac MRI findings, microbiology cultures, *Salmonella* species, inflammatory markers (erythrocyte sedimentation rate and C-reactive protein), cardiac biomarkers and severity of illness were collected using data extraction sheets. Cases were classified by age
