Glycated hemoglobin and its spinoffs: Cardiovascular disease markers or risk factors?

Jumana Saleh

Abstract

Atherosclerosis is a major complication of diabetes, increasing the risk of cardiovascular related morbidities and mortalities. The hallmark of diabetes is hyperglycemia which duration is best predicted by elevated glycated haemoglobin A_{1c} (HbA_{1c}) levels. Diabetic complications are usually attributed to oxidative stress associated with glycation of major structural and functional proteins. This non-enzymatic alkylation of long lived proteins such
