**Incidence and trends of cardiovascular mortality after common cancers in young adults: Analysis of surveillance, epidemiology and end-results program**

**Sadeer G Al-Kindi, Guilherme H Oliveira****Abstract**

**AIM:** To describe the incidence of cardiovascular mortality (CVM) in survivors of major cancers and identify its trends over the past two decades.

**METHODS:** We used the SEER 19 registry to identify young adults (20–49 years), diagnosed with the following major primary cancers: lung, breast, liver/intrahepatic bile duct, pancreas, prostate, colorectal, and ovarian from 1990 through 2012 and identified the cumulative incidence of CVM after adjusting for confounding factors.

**RESULTS:** We identified a total of 301,923 cancers (breast 173,748, lung 38,938, colorectal 31,722, prostate 22,848, ovary 16,065, liver 9,444, pancreas 9,158). A total of 2,297 (0.8%) of patients had incident CVM. Lung (10-year cumulative CVM 2.4%) and
