Hitting a Moving Target: Successful Management of Diffuse ...

[https://www.clinical-lymphoma-myeloma-leukemia.com/article/S2152-2650\(18\)30687-6/fulltext](https://www.clinical-lymphoma-myeloma-leukemia.com/article/S2152-2650(18)30687-6/fulltext)

Micro-Abstract Lymph nodes in the mesentery are a common location for non-Hodgkin lymphoma; however, there is often concern regarding the use of **radiation therapy** (RT) for patients with mesenteric involvement owing to unpredictable target motion. We **report** the successful incorporation of RT for patients' diffuse large B-cell lymphoma and mesenteric involvement through the utilization of ...

Abstract

BACKGROUND

Infiltration of the breast by leukemic cells is uncommon but may manifest as an oncological emergency requiring prompt management. Extramedullary relapse of T-cell acute lymphoblastic leukemia (T-ALL) within the breast is exceedingly rare and there is paucity of data in the literature regarding this entity. No consensus exists on management of isolated extramedullary breast relapses of T-ALL. Herein, we report a case of isolated extramedullary breast relapse of T-ALL treated with breathing adapted radiation therapy (BART) using active breathing control (ABC) system.

CASE SUMMARY

The patient was a 33-year-old female with diagnosis of T-cell ALL. She received intensive systemic chemotherapy which resulted in complete remission of her disease, and then underwent allogeneic hematopoietic stem cell transplantation. After a 15 month period without symptoms and signs of progression, the patient presented with palpable masses in both breasts. She complained from severe pain and swelling of the
