Esophagogastric junction adenocarcinoma: Preoperative chemoradiation or perioperative chemotherapy?

Francisco Laxague, Francisco Schlottmann

Abstract

Multimodal treatment is currently the standard of care for locally advanced esophagogastric junction (EGJ) adenocarcinoma due to poor results after surgery alone.

Neoadjuvant therapy is intended to shrink the tumor and eliminate potential circulating

BACKGROUND: The survival of patients with locoregional adenocarcinoma of the esophagus or the esophagogastric junction (EGJ) who receive **preoperative chemoradiation** is reported to be better among patients who achieve a pathologic complete response than among patients who have residual tumor, including lymph node (LN) metastasis.

Conclusions

The role of **neoadjuvant chemoradiotherapy** in the treatment of patients with esophageal or esophagogastric-junction cancer is not well established. We compared chemoradiotherapy followed by surgery with surgery alone in this patient population.
