Biomarkers in triple negative breast cancer: A Review

Budhi S Yadav, Priyanka Chanana, Swaty Jhamb

Abstract

Breast cancer is an intrinsically heterogeneous disease. In the world about 1 million cases of breast cancer are diagnosed annually and more than 170,000 are triple-negative. Characteristic feature of triple negative breast cancer (TNBC) is that it lacks expression of oestrogen, progesterone and HER-2/neu receptors. They comprise 15-20% of all breast cancers. We did a systematic review of Pub Med and conference databases to identify studies published on biomarkers in TNBC. We

In addition, we review the potential use of emerging biomarkers as surrogates for molecular molecular markers for TNBC and basal-like breast cancer.
