Gastro-entero-pancreatic neuroendocrine tumors: is now time for a new approach?

Rossana Berardi, Mariangela Torniai, Agnese Savini, Silvia Rinaldi, Stefano Cascinu

**Abstract**

Gastro-entero-pancreatic tumors (GEP-NETs) are rare neoplasms often characterized by an overexpression of somatostatin receptors (SSTR). Thus, radiolabeled somatostatin analogues have showed an increasing relevance both in diagnosis and treatment, especially in low- and intermediate-differentiated GEP-NETs. These evidences have led to a growing development of new functional imaging techniques as <sup>68</sup>Ga-DOTATATE PET/CT proved useful in the management of these neoplasms. However these tumors have a heterogeneous behavior also modifying their aggressiveness through time. Therefore sometimes <sup>18</sup>FDG PET/TC appears to be more appropriate to obtain a better assessment of the disease. According to these considerations, the combination of different
