Potential prognostic biomarkers in pancreatic juice of resectable pancreatic ductal adenocarcinoma

Shefali Agrawal

Abstract

Despite potentially curative surgery pancreatic cancer has a dismal prognosis. Serum CA 19-9 correlates with tumor burden, resectability and survival in patients with pancreatic ductal adenocarcinoma. Identification of novel biomarkers may facilitate early diagnosis of pancreatic cancer and improve survival. Pancreatic juice is a rich source of cancer-specific proteins rendering it a promising tool for identifying biomarkers. Recent proteomic and microRNA expression analyses have identified several biomarkers of potential diagnostic
