Factors associated with trigger digit following carpal tunnel release

### Abstract

#### **BACKGROUND**

Trigger digit is a common disorder of the hand associated with carpal tunnel syndrome. Carpal tunnel release (CTR) surgery may be a risk factor for trigger digit development; however, the association between surgical approach to CTR and postoperative trigger digit is equivocal.

Several pulleys hold this tunnel in the correct position in the hand. Inflammation and swelling in the tendon sheath progressively limit the tendon's ability to glide smoothly. The tendon gets stuck as it travels under the pulleys, causing the thumb to temporarily \"catch\" or lock in the midst of trying to bend...

**Carpal tunnel syndrome** and **trigger finger** (TF) frequently present concomitantly; some studies suggest that carpal tunnel release (**CTR**) is a risk **factor** for the development of ipsilateral TF in the postoperative period. The primary objective of this study was to elucidate the relationship between CTR and the subsequent development of TF.
