³ Return to sport following scaphoid fractures: A systematic review and meta-analysis

Joaquim S Goffin, Quintin Liao, Gregory AJ Robertson

Abstract

BACKGROUND

Scaphoid fractures is the most commonly fractured carpal bone in the athletic patient, account for over 85% of all sport-related carpal bone fractures, and are particularly common in sports involving high impact injuries to the wrist. The management of such injuries comprises both conservative and surgical techniques, as guided by fracture location and type. Athletes demonstrate a unique challenge with regards to the management of scaphoid fractures due to their requirement to return to sport, as soon as able.
