Total knee arthroplasty for treatment of post-traumatic arthritis: Systematic review

Hesham Saleh, Stephen Yu, Jonathan Vigdorich, Ran Schwarzkopf

Abstract

AIM: To review and report functional outcomes, complications, and survivorship associated with total knee arthroplasty(TKA) in the treatment of post-traumatic arthritis(PTA)

METHODS: We conducted a systematic review according to the PRISMA guidelines. We searched PubMed, Cochrane Library, and SCOPUS in December 2015 for English-language clinical research studies, both prospective and retrospective, examining the use of TKA for the treatment of PTA. All relevant articles were accessed in full. The manual search included references of retrieved articles. We extracted data on patients' demographics and clinical outcomes, including preoperative diagnosis and pre- and post-operative functional scores. We summarized the data and reported the results in tables and text.

RESULTS: Sixteen studies, four prospective and ten retrospective, examined patients who underwent TKA for PTA due to fractures of the proximal tibia, patella, and/or distal femur. Eleven studies utilized the KSS criteria to assess functional outcomes. All
