Zosteriform cutaneous leiomyoma-Type II: An uncommon presentation

Authors: Anupam Das, Indrashis Podder, Anupama Ghosh

Abstract

Cutaneous leiomyomas are rare, benign smooth muscle tumors, characterized by painful nodules in most of the cases. They can occur in multiple disseminated, segmental or zosteriform and solitary forms. Segmental or zosteriform leiomyoma can occur either alone (Type I), or with scattered nonsegmental lesions elsewhere (Type II); the latter variety occurring rarely. Here we present a case of type II zosteriform leiomyoma in a middle aged individual.

Key Words: Cutaneous; leiomyoma; zosteriform

CORE TIP

The most interesting feature of this case is the rarity of the presentation of the entity. Leiomyoma is not uncommon but zosteriform presentation is a relatively rare condition. Besides, discrete lesions apart from the zosteriform pattern, gives it the nomenclature of Type II zosteriform leiomyoma which is worth reporting.
