Pediatric ocular rosacea, a misdiagnosed disease with high morbidity: Proposed diagnostic criteria

Cláudia Arriaga, Mariana Domingues, Guilherme Castela, Manuel Salgado

Abstract

Ocular rosacea is an important and underdiagnosed chronic inflammatory disorder observed in children. A clinical spectrum ranging from chronic eyelid inflammation, recurrent ocular redness, photophobia and/or hordeola/chalazions and conjunctival/corneal phlyctenules evolving to neovascularization and scarring may occur. Visual impairment and consequent amblyopia are frequent and corneal perforation, although rare is the most feared complication. Ocular manifestations

A case of severe pediatric ocular rosacea was effectively treated after 2.5 years of misdiagnosis. A high index of suspicion should be maintained in children with ocular surface disease, with or without dermatologic rosacea, to correctly diagnose ocular rosacea and avoid morbidity and complications.
