Update on human papillomavirus vaccination: Where are we now?

Eloise Chapman-Davis, Lauren E Dockery, Kendall Griffith, Caroline Stroup

## Abstract

Infection with <sup>2</sup>human papillomavirus (HPV) is the major cause of pre-invasive and invasive lesions of the urogenital tract, resulting in morbidity and mortality worldwide. HPV-related infection is responsible for most cases of cervical cancer, <sup>14</sup>an leading cause of cancer death in women worldwide. Developed countries have <sup>31</sup>screening programs in place to detect precancerous lesions at early stages; in resource-limited settings however, HPV related diseases are often identified in advanced stages. This is due to limitations in the availability and roll out of effective screening programs. The relatively recent availability of the HPV vaccine has provided a new public health opportunity to decrease the incidence of HPV-related disease. The high mortality rates seen in developing countries <sup>38</sup>could be reduced through effective implementation of HPV vaccination programs. Large trials have proven the efficacy of bivalent, quadrivalent vaccine and most recently 9-valent vaccine. Uptake in vaccination remains low due to
