1
Periosteal pedicle graft for the treatment of gingival recession-a viable alternative to sub-epithelial connective tissue graft

Ajay Mahajan

Abstract

Treating gingival recessions is important to satisfy the functional and aesthetic needs of the patients. Among various available techniques to treat gingival recessions, **3** the subepithelial connective tissue graft technique is still considered to be the best despite its inherent disadvantages. The recent innovation utilising periosteum as a pedicle graft to treat gingival recession defects has drawn
