Understanding academic clinicians' intent to treat pediatric obesity

Claudia Frankfurter, Charles Cunningham, Katherine M. Morrison, Heather Rimas, Karen Bailey

Abstract

AIM: To examine the extent to which the theory of planned behavior (TPB) predicts academic clinicians' intent to treat pediatric obesity.

METHODS: A multi-disciplinary panel iteratively devised a Likert scale survey based on the constructs of the TPB applied to a set of pediatric obesity themes. A cross-sectional electronic survey was then administered to academic clinicians at tertiary care centers across Canada from January to April 2012. Descriptive statistics were used to summarize demographic and item agreement data. A hierarchical linear regression analysis controlling for demographic variables was conducted to examine the extent to which the TPB subscales predicted intent to treat pediatric obesity.

RESULTS: A total of 198 physicians, surgeons, and allied health professionals across Canada (British Columbia, Alberta, Manitoba, Saskatchewan, Nova Scotia, Ontario and Quebec) completed the survey. On step 1, demographic factors accounted for 7.4% of
