Chronic kidney disease after radical nephrectomy for suspected renal cancers

Tuck Y Yong, Kareeann SF Khow

**Abstract**

Nephrectomy is the treatment of choice for early stage renal cell carcinoma. However, radical nephrectomy is consistently associated with higher rates of new-onset chronic kidney disease (CKD) than the general population, regardless of the method used in measuring renal function. The higher rates of CKD is associated with worsened survival because of increased risk of cardiovascular diseases and mortality. Comorbidities and adjacent non-
