Bilingualism and schizophrenia

Mary V Seeman

Abstract

Although a bilingual advantage has been described for neurodegenerative disease in general, it is not known whether such an advantage could accrue to individuals suffering from schizophrenia, since language networks are known to be disrupted in this condition. The aim of this minireview was to scan the existing literature to determine a) whether individuals with schizophrenia are able to learn a second language as adults, b) whether clinical assessment, both for the purpose of accurate diagnosis and for the prediction of treatment response, should be carried out in both languages in bilinguals with schizophrenia, c) whether psychotherapy in schizophrenia is affected by bilingualism and d) whether speaking a second language improves outcome in schizophrenia. The literature to date is too sparse to make definitive statements, but a) individuals with schizophrenia appear to be capable of learning a new languages as adults, and b) it is possible that teaching a foreign language may serve as a form of cognitive rehabilitation for this condition
