Mala Sachdeva, Lisa M Rosen, Jeny Varghese, Steven Fishbane, Ernesto P Molmenti

**Abstract****AIM:** To analyze the national trends associated with Body Mass Index (BMI) and living kidney donation.**METHODS:** 47,705 adult living kidney donors as reported to the OPTN from 1999 to 2011 were analyzed using their pre-donation BMI. Predictor variables of interest included age, gender, ethnicity, relationship, education status, and transplant region.**RESULTS:** 16,971 of the living kidney donors were normal weight (35.6%); 19,337 were overweight (40.5%); 9007 were mildly obese (18.9%); 1992 were moderate to morbidly obese (4.2%). Overweight and mildly obese kidney donors have increased through time by 12% and 20% every 5 years, respectively ( $p < 0.05$ ). Donors 35-49 years of age, hispanic males or females and black females, those with high school diploma or GED,**Match Overview**
