Dynamics of circulating microparticles in chronic kidney disease and transplantation: Is it really reliable marker?

Ismail Dursun, Sibel Yel, Emel Unsur

Abstract

The deterioration of endothelial structure plays a very important role ² in the development of vascular diseases. It is believed that endothelial dysfunction starts in the early stage of kidney disease and is a risk factor of an unfavorable cardiovascular prognosis. Because a direct assessment of biological states in endothelial cells is not applicable, the measurement of endothelial microparticles ³ detached from
